3D modeling software is similar to AutoCAD, and has been available for many years. Although CAD software is not limited to modeling, it is often used as the first step in 3D modeling, as it provides a faster way to model complex objects and it is often used to define parametric geometry

(from which 3D models can be created). AutoCAD is often used as a file format. CAD data files can contain 3D models, 2D drawings, and more; and many applications, including many drawing tools, can produce their own CAD data files. Many variations and enhancements of AutoCAD are continually being developed, by Autodesk as well as by third-party developers.

History of AutoCAD
AutoCAD was originally designed as a 3D CAD system (although it does have a 2D layout tool), and it was first introduced in December 1982.

AutoCAD was developed as a direct competitor to the Sketch/Draw system developed by a group of engineers at the U.S. Naval Air Systems Command (NAVAIR) in the early 1980s. One of the engineers, Rich Smith, later known as

the inventor of PostScript, designed a new "real-time" drawing algorithm for the Sketch/Draw system. This drawing algorithm was later incorporated into AutoCAD. Early years The original design of AutoCAD was not a CAD application—the name AutoCAD comes from the first two letters of the names of the principal inventors of the computer on which the application was initially developed:

the Auto CAD-I. The original design was based on an interpreter program that interpreted 3D US Department of Defense (DoD) Computer Aided Design (CAD) data standards. The three principal inventors (A. Dick, J. Joiner, and R. Smith) also helped develop the first DoD CAD standards.

Richard Smith, one of the principal inventors of AutoCAD, was a computer engineer at the Navy's Varian

Associates division, in Palo Alto, California. The Navy wanted to develop a system to allow them to quickly draw pictures of aircraft, in order to train their personnel. Dick was a pioneer in the field of real-time three-dimensional (3D) graphics and had devised a drawing algorithm that could display a 3D model in real time. At the time that he worked

automation. The @sLIN

is an interface that can be used to automate the @AutoCAD application using the programming languages and libraries listed above. It provides a standard XML based approach to automate the application. The @sAPI is an interface to perform the automation in AutoCAD from the outside world. The ABI supports all parts of the AutoCAD package. It is one of the few commercial

applications that contains all the functionality of the other products of Autodesk. ABI was developed by Paul Parker and his wife, Patty Parker, from 1982 to 1999. On January 12, 1999 Autodesk acquired this technology. AutoCAD was initially used for rapid design and presentation of architectural drawings and later with civil engineering drawings. In the early 2000s, the

industry started to use a new version of the ABI API called @sLIN. The old API has been kept as a compatibility layer, because many users do not have ABI software installed. The LIN/ILS is a software that works on top of the ABI API, allowing developers to create their own automation applications on top of it. With ABI, an application can create content, synchronize it with AutoCAD, or exchange data. This

includes "autoscripts" that can automate parts of the application. AutoCAD, unlike other applications, is designed in a way that it requires a developer to create an autoscript to automate a specific function. The ABI API makes this easy.

AutoCAD, however, does not support using third-party automation tools in order to create custom commands. ABI applications can be Windows-based or Mac-

based. At the end of 2018, a new version of the API is being introduced, called "@AutoCAD: Custom". The major differences are: The rendering API is now written in C++ instead of LISP. The new API is more like the .NET framework. The application is not restricted to AutoCAD but can support third-party applications, such as AutoCAD

Open Autocad as administrator, and click on the Tools, Parameters, Preference. Click on the Non-English menu and click on the Region language you want to use, here I chose Romanian. Set this language as default. Open the language menu, at the end click on Options. At the bottom, under the Options, select our regional language

(Romanian). You can set the Language on the Schematic menu too. Open the Schematic menu. Go to the International menu and set the Romanian language, as explained above. Next, go to the main menu, open the Import menu. Click on the Serif Fonts submenu. Click on Serif, then Serif Type and select our Romanian language and its "orientation" (right-to-left). Then go to the Advanced menu

and open the Advanced menu. Open the Drafting menu and click on the Object menu, then click on the Triangle Tool. At the bottom, select the Tool and set its Size as 4 and its Shape as "Straight". Open the Precision menu and set the Length of the Lines as 5. Go to the Standard menu and set the Shape as "Triangle". Next, open the Text menu and set the Type as Bold, the Orientation as Roman

and the letter spacing as the Standard. Set the color of the text (Click on the color picker and choose the color, in my case #DDC04A, the swatch number is 5). Open the Style menu and set the Font as 'Brush', Font Size as 2, then click on the font (Arial) and you'll open a new window with all the details about the font (for example, where is the font on your computer). If you don't see the Font window,

you can open it with a right mouse click on the text. Click on the dialogue buttons, then go to Window, and then to Linked Windows. Click on the Data/Formats/Text menu and open the Font Data Window. Click on the Font Name, then on the bottom right, where it says Size, choose size 4. Next, click on the Underline/Strikeout box and select the "Underline" option. You can also select the

"Strikeout" option.
Next, click on the Text
menu and go to the
Text Style. Choose the

AutoCAD 2020 The
Fusion Technology in
AutoCAD 2020 toolset
allows users to
combine elements of a
design created in a
native application and
import that design into

AutoCAD to create a complete, editable representation of that design. The design elements can include paths, curves, splines, 2D drawings, and 3D meshes. When elements from different formats are combined, a consistent visual representation is created. For example, this technology can be used to connect multiple 3D meshes together or combine 2D information from a layout template with a

3D curve. If parts of a design are created in different software applications, you can connect them to the original and make the entire design available in one drawing. To learn more, see the Fusion Technology in AutoCAD article.
